

7.1.2 Water Distribution System:

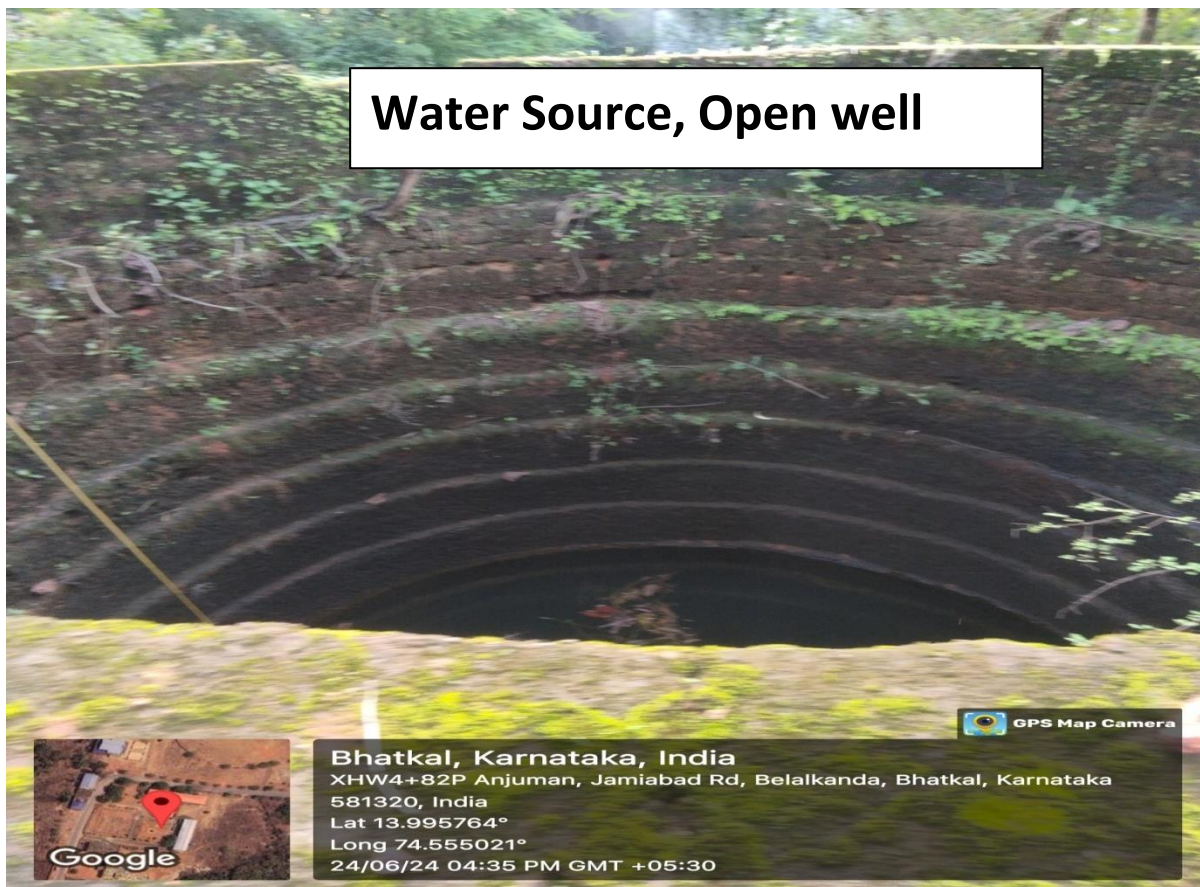

The College has adopted strategies to maintain the water bodies and has implemented a good design for proper distribution of water in the campus. The Institution aims to provide the best services to the students in all the possible ways, in education facilities, in infrastructure and in basic necessities like water. The institution functions with the help of ground water. The institution is situated on hill top area called Anjumanabad.

Water is moving down from hill top area hence the institution has its own open well below the hill top area. Open well below the hill top area provides sufficient water to all Anjuman institutions during all the season and the institution never faces the problem of water. The ground water from well is filtered and then pumped to the main storage tanks then supplied to smaller tanks placed at different locations in the campus. The water is distributed through well laid pipe network. The entire distribution system is well supervised.

WATER DISTRIBUTION THROUGH DRIP AND SPRINKLER IRRIGATION:

Drip irrigation facility has been provided to garden for efficient use of water during non-rainy season. Drip Irrigation involves placing tubing with emitters on the ground alongside the plants. The emitters slowly drip water into the soil at the root zone. Because moisture levels are kept at an optimal range, plant productivity and quality improve. Drip irrigation is the most efficient water and nutrient delivery system for growing crops. It delivers water and nutrients directly to the plant's roots zone, in the right amounts, at the right time, so each plant gets exactly what it needs, when it needs it, to grow optimally. Water and nutrients are delivered across the garden in 'dripper lines' featuring smaller units called Drippers. Each dripper emits drops containing water and fertilizers, resulting in the uniform application of water and nutrients direct to each plant's root zone, across an entire garden within the campus.

Sprinkler Irrigation

Garden turf has been irrigated through sprinkler irrigation, water is distributed by pipes by pumping surrounding garden surface through spray heads. This system is mainly used during non-rainy season
